SUMMARY

Software Engineer and General Assembly Software Engineering Immersive graduate who builds full-stack web and mobile applications with TypeScript, React, Python, and PostgreSQL. Built and launched Mythos, a live web application that integrates the Blizzard API with a PostgreSQL database, Redis caching, and automated tests. Focused on clean architecture: testable business logic separated from the user interface, validated API integrations, and maintainable code.

SKILLS

Languages: TypeScript, JavaScript, Python, Dart, Go, Java, SQL, HTML, CSS

Frontend and Mobile: React, Next.js, Astro, React Native, Expo, Flutter, Electron, Tailwind CSS

Backend and Databases: Node.js, Django, GraphQL, REST APIs, PostgreSQL, Drizzle ORM, Redis, SQLite, Zod

Testing and DevOps: Vitest, Playwright, unit testing, end-to-end testing, Docker, Git, GitLab, Bun, Vercel, Cloudflare, Linux, Bash

Practices: Clean architecture, API integration, data validation, caching, monorepo management, responsive design

PROJECTS

Mythos - World of Warcraft Gear Planner

2026

Astro, React, TypeScript, PostgreSQL, Drizzle ORM, Redis, Zod, Expo, Vitest, Playwright | mythosbis.com

- Built and launched a live web application that pulls a player's equipped gear from the Blizzard API and compares it slot by slot against a Best-in-Slot (BiS) list for their class and specialization.
- Secured the Blizzard API integration by calling it only from the server, validating every response with Zod, and caching results in Redis (Upstash) to reduce repeated API calls.
- Designed the PostgreSQL database with Drizzle ORM, seeding Best-in-Slot data per class and specialization and keeping season settings in a single configuration file.
- Wrote the gear comparison engine as a pure TypeScript function separated from the user interface, including pair matching for rings and trinkets, and covered it with Vitest unit tests and Playwright end-to-end tests.
- Restructured the codebase into a Bun workspaces monorepo with an Astro and React web app, an Expo mobile app, and shared core, API client, and API contract packages; deployed the web app on Vercel.

Falar - Brazilian Portuguese Learning Platform

Electron, React, Flutter, Dart, GraphQL, TypeScript, PostgreSQL, Python

- Built one language-learning product across three repositories that share one domain model: an Electron and React desktop app, a Flutter mobile app, and a TypeScript GraphQL backend on PostgreSQL.
- Started the product as a Python command-line app with flashcards, quizzes, and vocabulary drills, then expanded it to desktop and mobile with an architecture suited to each platform.

Movie App

React Native, TypeScript, Tailwind CSS, Axios

- Built a React Native mobile app for browsing trending, upcoming, and top-rated movies, with search and detailed cast and filmography pages, using Axios to consume a third-party REST API.

Additional Projects

- Django backend deployed on Heroku (Python); practice REST API and HTMX ordering demo (Go); command-line tools in Python and Java.

EDUCATION

General Assembly - Software Engineering Immersive

2023

Full-time program in full-stack web development: JavaScript, TypeScript, React, Node.js, Python, Django, SQL databases, and Git.
